INTERNATIONAL PRELIMINARY EXAMINATION REPORT

Document 7: Y. Lee et al., "The Nuclear RNase III Drosha Initiates microRNA Processing," Nature, 25 September 2003, Vol. 425, No. 6956, pp. 415-419

Document 8: I. PAPP, et al., "Evidence for Nuclear Processing of Plant Micro RNA and Short Interfering RNA Precursors," Plant Physiol., July 2003, Vol. 132, No. 3, pp. 1382-1390

Claims 1, 2, 4, 7, 13-16, 19-21, 24 and 25

Document 1 presents a double stranded RNA expression vector wherein the sequence which codes double-stranded RNA (ds-RNA) with a hairpin RNA structure, which is to say a system loop structure, is located immediately after the transcriptional start site for the polymerase II promoter from the cytomegalovirus (CMV), and a poly A sequence, which is to say a sequence that stops the RNA polymerase, is located on the 3' side. In addition, document 1 indicates that the double stranded RNA expression vector in question has been injected into the tails or the brains of mice. Consequently, the inventions that are set forth in the abovementioned claims are the same as the inventions that are presented in document 1; therefore, they lack novelty.

Claims 3 and 4

A person skilled in the art could choose to substitute CMV early gene promoters that were well known to a person skilled in the art prior to the priority date of the present application for the polymerase II promoter from CMV which is disclosed in document 1 in order to accommodate the expression period or the like of the gene to be knocked down, as appropriate. In addition, the invention that is set forth in the abovementioned claims cannot be considered to exhibit any especially prominent

INTERNATIONAL PRELIMINARY EXAMINATION REPORT

effect as a result of the configuration in question. Consequently, the invention that is set forth in the abovementioned claims does not involve an inventive step in the light of the disclosures of document 1 and the abovementioned well-known technology.

Claims 5 and 6

It would be easy for a person skilled in the art to conceive of introducing an autocatalytic RNA-cleaving ribosome into a vector in the light of the disclosures of document 2, and the invention that is set forth in the abovementioned claims cannot be considered to exhibit any especially prominent effect as a result of the configuration in question. Consequently, the invention that is set forth in the abovementioned claims does not involve an inventive step in the light of the disclosures of documents 1 and 2.

Claim 8

Document 4 presents the MAZ domain, and it cannot be considered to be especially difficult to substitute the MAZ domain for the poly A sequence; therefore, the invention that is set forth in the abovementioned claim does not involve an inventive step in the light of the disclosures of documents 1 and 4.

Claim 9

With consideration of common technical knowledge prior to the priority date of the present application, a person skilled in the art could have determined the base sequence that codes the loop region, as necessary, and the invention that is set forth in the abovementioned claim cannot be considered to exhibit any especially prominent effect as a result of the configuration in question. Consequently, the invention that is set forth in the

abovementioned claim does not involve an inventive step in the light of the disclosures of document 1 and common technical knowledge prior to the priority date of the present application.

Claims 10-12, 17, 18, 22 and 23

It would be easy for a person skilled in the art to conceive of targeting disease-related genes by means of ds-RNA, and there is not seen to be any significant difficulty in employing the Ski gene indicated in prior art citation 5, which was well known prior to the priority date for the present application as presented in the GenBank database, for that purpose. In addition, the inventions that are set forth in the abovementioned claims cannot be considered to exhibit any especially prominent effect as a result of the configuration in question; consequently, the inventions that are set forth in the abovementioned claims do not involve an inventive step in the light of the disclosures of document 1 and prior art citation 5.

Furthermore, documents 7 and 8, which were published after the priority date of the present application, indicate the existence of proteins that act in a similar manner to Dicer within the nucleus. That being said, prior to the priority date of the present application it is considered to have been impossible for a person skilled in the art to foresee that it would be possible to induce RNA interference without translocating the cytoplasm by introducing ds-RNA into the nucleus. However, the scope of the inventions that are set forth in the claims is not limited only to inventions wherein transcribed ds-RNA is introduced into the nucleus; therefore, the abovementioned opinions have been appended.
